2021 Year 10 Science B – Sustainable Systems of Health and Energy

2021 Year 10 ACARA – Science B Unit 1: ENERGY AND SUSTAINABLE SYSTEMS

The program includes the SCSA (School Curriculum and Standards Authority) content, 21CLD elements (self-regulation, knowledge construction, ICT and skillful communication), study skills and 'Habits of Mind' skills

Science Content Descriptions

Science Understanding

Earth and Space Sciences/Biological Sciences

Global systems, including the carbon cycle, rely on interactions involving the biosphere, lithosphere, hydrosphere and atmosphere (ACSSU189)

- 1. Investigating how human activity affects global systems
- 2. Modelling a cycle, such as the water, carbon, nitrogen or phosphorus cycle within the biosphere
- 3. Explaining the causes and effects of the greenhouse effect
- 4. Investigating the effect of climate change on sea levels and biodiversity
- 5. Considering the long-term effects of loss of biodiversity
- 6. Investigating currently occurring changes to permafrost and sea ice and the impacts of these changes
- 7. Examining the factors that drive the deep ocean currents, their role in regulating global climate, and their effects on marine life

Chemical Sciences

Different types of chemical reactions are used to produce a range of products and can occur at different rates (ACSSU187)

- 1. investigating how chemistry can be used to produce a range of useful substances such as fuels, metals and pharmaceuticals
- 2. predicting the products of different types of simple chemical reactions
- 3. using word or symbol equations to represent chemical reactions
- 4. investigating the effect of a range of factors, such as temperature and catalysts, on the rate of chemical reactions

Physical Sciences

Energy conservation in a system can be explained by describing energy transfers and transformations (ACSSU190)

- 1. Recognising that the Law of Conservation of Energy explains that total energy is maintained in energy transfer and transformation
- 2. Recognising that in energy transfer and transformation, a variety of processes can occur, so that the usable energy is reduced, and the system is not 100% efficient
- 3. Using models to describe how energy is transferred and transformed within systems

Science as a Human Endeavour

The nature and development of Science

Scientific understanding, including models and theories, are contestable and are refined over time through a process of review by the scientific community (ACSHE191)

1. Considering the role of science in identifying and explaining the causes of climate change

Use and influence of science

People can use scientific knowledge to evaluate whether they should accept claims, explanations or predictions (ACSHE194)

- 1. Describing how science is used in the media to explain a natural event or justify people's actions.
- 2. Considering the scientific knowledge used in discussions relating to climate change.
- 3. Evaluating claims relating to environmental footprints.

Advances in science and emerging sciences and technologies can significantly affect people's lives, including generating new career opportunities (ACSHE195)

1. Recognising that scientific developments in areas such as sustainable transport and low-emissions electrical generation require people working in a range of fields of science, engineering and technology.

The values and needs of contemporary society can influence the focus of scientific research (ACSHE230)

- 1. Investigating technologies associated with the reduction of carbon pollution, such as carbon capture.
- 2. Considering innovative energy transfer devices, including those used in transport and communication.
- 3. Investigating the use and control of CFCs based on scientific studies of atmospheric ozone.
- 4. Recognising that financial backing from governments or commercial organisations is required for scientific developments and that this can determine what research is carried out.

Science Inquiry Skills

Questioning and predicting

Formulate questions or hypotheses that can be investigated scientifically (ACSIS198)

1. Developing hypotheses based on well-developed models and theories.

- 2. Using internet research to identify problems that can be investigated.
- 3. Formulating questions that can be investigated within the scope of the classroom or field with available resources.
- 4. Developing ideas from students own or others' investigations and experiences to investigate further.
- 5. Evaluating information from secondary sources as part of the research process

Planning and conducting

Plan, select and use appropriate investigation methods, including field work and laboratory experimentation, to collect reliable data; assess risk and address ethical issues associated with these methods (ACSIS199)

- 1. Using modelling and simulations, including using digital technology, to investigate situations and events.
- 2. Deciding how much data are needed to produce reliable measurements.

Select and use appropriate equipment, including digital technologies, to systematically and accurately collect and record data (ACSIS200)

1. Identifying where human error can influence the reliability of data.

Processing and analysing data and information

Analyse patterns and trends in data, including describing relationships between variables and identifying inconsistencies (ACSIS203)

- 1. Using spreadsheets to present data in tables and graphical forms and to carry out mathematical analyses on data.
- 2. Describing sample properties (such as mean, median, range, large gaps visible on a graph) to predict characteristics of the larger population, acknowledging uncertainties and the effects of outliers.
- 3. Exploring relationships between variables using spreadsheets, databases, tables, charts, graphs and statistics

Use knowledge of scientific concepts to draw conclusions that are consistent with evidence (ACSIS204)

1. Constructing a scientific argument showing how their evidence supports their claim.

Evaluating

Evaluate conclusions, including identifying sources of uncertainty and possible alternative explanations, and describe specific ways to improve the quality of the data (ACSIS205)

1. Identifying alternative explanations that are also consistent with the evidence.

Communicating

Communicate scientific ideas and information for a particular purpose, including constructing evidence-based arguments and using appropriate scientific language, conventions and representations (ACSIS208)

- 1. Constructing evidence-based arguments and engaging in debate about scientific ideas.
- 2. constructing evidence-based arguments and engaging in debate about scientific ideas
- 3. presenting results and ideas using formal experimental reports, oral presentations, slide shows, poster presentations and contributing to group discussions
- 4. Using a range of representations, including mathematical and symbolic forms, to communicate science ideas

LINKS TO SENIOR EARTH AND ENVIRONMENTAL SCIENCE /BIOLOGICAL / CHEMICAL /PHYSICAL SCIENCE COURSES

Earth and Environmental Science

- 1. Understand how theories and models have developed based on evidence from multiple disciplines; and the uses and limitations of Earth and environmental science knowledge in a range of contexts
- 2. Use science inquiry skills to collect, analyse and communicate primary and secondary data on Earth and environmental phenomena; and use these as analogues to deduce and analyse events that occurred in the past.
- 3. Communicate Earth and environmental understanding using qualitative and quantitative representations in appropriate modes and genres.
- 4. Understand how energy is transferred and transformed in Earth systems, the factors that influence these processes, and the dynamics of energy loss and gain.
- 5. Understand how energy transfers and transformations influence oceanic, atmospheric and biogeochemical cycling.
- 6. Understand how theories and models have developed based on evidence from multiple disciplines; and the uses and limitations of Earth and environmental science knowledge in a range of contexts.
- 7. Evaluate, with reference to empirical evidence, claims about energy transfers and transformations between and within Earth systems.
- 8. Understand the difference between renewable and non-renewable Earth resources and how their extraction, use, consumption and disposal impact Earth systems.
- 9. Understand how renewable resources can be sustainably extracted, used and consumed at local, regional and global scales.

- 10. Understand how models and theories have developed over time; and the ways in which Earth and environmental science knowledge interacts with social, economic, cultural and ethical considerations in a range of contexts.
- 11. Understand the causes of Earth hazards and the ways in which they impact, and are impacted by, Earth systems
- 12. Understand how environmental change is modelled, and how the reliability of these models influences predictions of future events and changes
- 13. Understand how models and theories have developed over time; and the ways in which Earth and environmental science knowledge interacts with social, economic, cultural and ethical considerations in a range of contexts
- 14. Evaluate, with reference to empirical evidence, claims about Earth hazards and related impacts on Earth systems and justify evaluations
- 15. Communicate Earth and environmental understanding using qualitative and quantitative representations in appropriate modes and genres.

Biology

- 1. Understand that the structure and function of cells and their components are related to the need to exchange matter and energy with their immediate environment
- 2. Understand that multicellular organisms consist of multiple interdependent and hierarchically-organised systems that enable exchange of matter and energy with their immediate environment
- 3. Understand how the structure and function of the human body maintain homoeostasis.

Chemistry

- 1. Understand the concept of enthalpy, and apply this to qualitatively and quantitatively describe and explain energy changes in chemical reactions
- 2. Understand how the presence of functional groups and the molecular structure of organic compounds are related to their properties
- 3. Understand addition, condensation and oxidation reactions, and predict the products of these reactions
- 4. Understand how knowledge of chemical systems is used to design synthesis processes, and how data from analytical techniques provides information about chemical structure

Physics

- 1. Understand how the nuclear model of the atom explains radioactivity, fission, fusion and the properties of radioactive nuclides
- 2. Use algebraic and graphical representations to calculate, analyse and predict measurable quantities associated with heating processes, nuclear reactions and electrical circuits
- 3. Evaluate, with reference to empirical evidence, claims about heating processes, nuclear reactions and electrical technologies
- 4. Communicate physics understanding using qualitative and quantitative representations in appropriate modes and genres.

2021 Year 10 ACARA Science B: Sustainable Systems of Energy Module Two: Chemistry (Part One), Physics (Part Two), Biology/ Earth and Space Science (Part Three)

Big Picture:

Modern Humans have been on the planet for a significant amount of time. They have learnt how to use energy and they have modified their environment to sustain their increasingly complex lives. The need and use of energy brings its own complexities, so an understanding is needed to formulate reasoned positions for the production and consumption of energy. Students need to understand how energy is used in everyday life, how it is consumed both directly and indirectly. They will explore how energy flows through a system and how the resources are recycled, and the processes involved. They will assess and evaluate the impact of chemical weathering and deposition, as well as ocean acidification. How sustainable are the systems we use to harness energy? What are the alternatives?

Wk	Theme	Concepts / Content	Student objectives	Skills T = taught for 1st time R = reinforced	RESOURCES / ASSESSMENT/ PRACTICALS iSc10 = iScience Book 3, chapters 6 and 8
1 - 2	Term 3 Weeks 1 & 2 Energy Consumption & Fossil Fuels	 Introduction to the use of energy in everyday life. Use of energy directly. Use of energy indirectly. Fossil fuels Combustion of oil, gas and coal. Changes in energy release. Changing carbon concentrations. Atmospheric changes leading to global warming. 	 State what energy is. Describe what is meant by energy consumption. Explain how energy is used in everyday life. Describe the direct use of energy in everyday life, e.g. lighting heating, fuel for transport etc. Describe how energy is consumed indirectly. Explain how indirect consumption of energy is associated with the production of consumer goods, energy required to build homes and infrastructure, energy for transporting goods and growing food etc. Compare direct and indirect use of energy in everyday life. Review what is meant by a fossil fuel (coal, crude oil, natural gas). Explain what happens to the concentration of CO₂ in the atmosphere with the burning of fossil fuels. Describe the greenhouse effect using ideas about energy and radiation: Earth's surface absorbs visible light from 	Study skills: Research and referencing. (Using APA style) (R) 21CLD: Self- regulation (component for this is under construction and may include knowledge construction as well.) ICT Simulation Greenhouse effect https://phet.color	RESOURCES StileApp (Energy, Greenhouse Effect and Global Warming) Notes in Energy Consumption folder on Connect. Watch the documentary Crude: https://www.abc.net.au/science/crude/ (1:29:30). If low on time, use as homework task. I KNOWIENDE
Enrichment
16. Describe what carbon capture is and how it could
reduce atmospheric carbon dioxide.
17. Conduct an energy survey to identify how much
energy you or your household use.
18. Reflect on some of the practices you could do to
use less energy.
19. Construct a consequences wheel for global
warming. Put the phrase "global warming" in the
centre of the middle circle of the wheel. In the
next circle out, write "rise in average world
temperature." Consider the impact of this and
write them down in the second layer of circles. Fill

			in other ideas that result from "global warming" in the inner circles leading to the outer circles.		
3	Term 3 Weeks 3 & 4 (part of week 4 only) Organic Chemistry	 Carbon bonding. Alkanes, alkenes, alkynes, cyclic hydrocarbons. Naming of hydrocarbons using IUPAC Isomerism General equations for combustion. 	 State what organic chemistry is. Explain how fractional distillation works and describe how it is used to separate different substances within crude oil based on their boiling points, using ideas about evaporation and condensation. Recognise homologous series of hydrocarbons: alkanes, alkenes, alkynes, cycloalkanes, cycloalkenes. State what a functional group is and recognise functional groups of the homologous series listed above. Use general formulae to recognise members of homologous series. State what a saturated hydrocarbon is. State what an unsaturated hydrocarbon is. Write the names of hydrocarbons using the IUPAC naming system for substances with up to 8 carbons in the parent chain (straight and branched alkanes and alkenes, simple only (no branches): cycloalkanes, cycloalkenes, alkynes) Describe the molecular, condensed and structural formulae of hydrocarbons with up to 8 carbons in the parent chain. Use given information to predict names of hydrocarbons and infer molecular, condensed and structural formulae. Draw and identify structural isomers for hydrocarbons, including chain isomers and position isomers. Use IUPAC naming system to write names for structural isomers, using naming convention for 	21CLD/ICT – Use an online resource to visualise organic molecules in 3D. molview.org	 RESOURCES Notes in Organic Chemistry folder on Connect. Mass defect and
binding energy

- Fission and fusion reactions using conservation of nucleons and charge.
- Nuclear power stations. Basic structure and operation.

- 5. Describe what fission and fusion are and explain the differences between them.
- 6. Predict energy changes as a result of fission and fusion reactions.
- 7. State what is meant by mass defect and binding energy.
- 8. Predict conversions of mass into energy using $E = mc^2$.
- 9. Describe the main components of nuclear power stations.
- 10. Explain, in simple terms, how nuclear power stations work to generate electricity.
- 11. Analyse some advantages and disadvantages of using nuclear energy to generate electricity.

Extension

- 12. Discuss how radioisotopes are used in medicine.
- 13. Use algebraic and graphical representations to calculate, analyse and predict measurable quantities associated with heating processes, nuclear reactions and electrical circuits
- 14. Evaluate, with reference to empirical evidence, claims about heating processes, nuclear reactions and electrical technologies

Enrichment

- 15. Research the work of Niels Bohr.
- 16. Theorise about the impact of different sources of radiation used in everyday life.
- 17. Reflect on nuclear power as an alternative energy source. What considerations would need to be made?

Study skill: Communication in different ways (T)

- https://www.youtube.com/watch
 ?v=KWAsz59F8gA (Crash Course
 Nuclear Chemistry).
- https://www.youtube.com/watch ?v=FU6y1XIADdg (Crash Course on fission, fusion, mass defect).

ASSESSMENT

- Worksheets and homework as part of teacher mark. (5%)
- CAT: Report on nuclear issue (15%)
 - Peer marked in small groups
- Test on nuclear physics (80%)

PRACTICALS

- SPICE Building Atoms (Worksheet
 2.2 in Nuclear Energy folder)
- SPICE Decay Chain Builder (Worksheets 4.1-5.3)
- SPICE Fission and Fusion Learning Objects (Worksheets 6.1-6.3)
- SPICE Nuclear Reactor (Extension work and worksheets)

Year 10 ACARA Biology – Science B Unit 2: HUMAN HEALTH AND DISEASE Science B

How does the human body fight disease and sustain good health?

The program includes the SCSA (School Curriculum and Standards Authority) content, 21CLD elements (self-regulation, knowledge construction, ICT and skillful communication), study skills and 'Habits of Mind' skills.

Science Understanding

Biological sciences

Multi-cellular organisms rely on coordinated and interdependent internal systems to respond to changes to their environment (ACSSU175)

- 1. Investigating the response of the body to changes as a result of the presence of micro-organisms
- 2. Describing mutations as changes in DNA or chromosomes
- 3. Investigating the effects on humans of exposure to electromagnetic radiations such as X-rays and microwaves

Science as a Human Endeavour

Use and influence of science

People can use scientific knowledge to evaluate whether they should accept claims, explanations or predictions (ACSHE194)

4. Using knowledge of science to test claims made in advertising.

Advances in science and emerging sciences and technologies can significantly affect people's lives, including generating new career opportunities (ACSHE195)

1. Investigating the applications of gene technologies such as gene therapy and genetic engineering (in the context of health)

The values and needs of contemporary society can influence the focus of scientific research (ACSHE230)

1. Considering the use of genetic testing for decisions such as genetic counselling, embryo selection, identification of carriers of genetic mutations and the use of this information for personal use or by organisation such as insurance companies or medical facilities.

Science Inquiry Skills

Questioning and predicting

Formulate questions or hypotheses that can be investigated scientifically (ACSIS198)

- 6. Developing hypotheses based on well-developed models and theories.
- 7. Using internet research to identify problems that can be investigated.

- 8. Formulating questions that can be investigated within the scope of the classroom or field with available resources.
- 9. Developing ideas from students own or others' investigations and experiences to investigate further.
- 10. Evaluating information from secondary sources as part of the research process

Planning and conducting

Plan, select and use appropriate <u>investigation</u> methods, including <u>field work</u> and laboratory experimentation, to collect <u>reliable data</u>; assess risk and address ethical issues associated with these methods (ACSIS199)

- 3. Using modelling and simulations, including using digital technology, to investigate situations and events.
- 4. Deciding how much data are needed to produce reliable measurements.

Select and use appropriate equipment, including <u>digital technologies</u>, to systematically and accurately collect and record <u>data</u> (ACSIS200)

2. Identifying where human error can influence the reliability of data.

Processing and analysing data and information

Analyse patterns and trends in data, including describing relationships between variables and identifying inconsistencies (ACSIS203)

4. Using spreadsheets to present data in tables and graphical forms and to carry out mathematical analyses on data.

Use knowledge of scientific concepts to draw conclusions that are consistent with evidence (ACSIS204)

2. Constructing a scientific argument showing how their evidence supports their claim.

Evaluating

<u>Evaluate</u> conclusions, including identifying sources of uncertainty and possible alternative explanations, and describe specific ways to improve the quality of the <u>data</u> (ACSIS205)

2. Identifying alternative explanations that are also consistent with the evidence.

Communicating

Communicate scientific ideas and information for a particular purpose, including constructing evidence-based arguments and using appropriate scientific <u>language</u>, <u>conventions</u> and representations (ACSIS208)

- 5. Constructing evidence based arguments and engaging in debate about scientific ideas .
- 6. Using a range of representations, including mathematical and symbolic forms, to communicate science ideas

LINKS TO SENIOR BIOLOGICAL / HUMAN BIOLOGICAL SCIENCE COURSES

- 16. Understand the cellular processes and mechanisms that ensure the continuity of life, and how these processes contribute to unity and diversity within a species
- 17. Understand the processes and mechanisms that explain how life on Earth has persisted, changed and diversified over the last 3.5 billion years
- 18. Understand how <u>models</u> and <u>theories</u> have developed over time; and the ways in which biological knowledge interacts with social, economic, cultural and ethical considerations in a range of contexts
- 19. Use science inquiry skills to design, conduct, evaluate and communicate <u>investigations</u> into heredity, gene technology applications, and <u>population</u> gene pool changes
- 20. Infectious disease differs from other disease in that it is caused by invasion by a pathogen and can be transmitted from one host to another
- 21. Zoonoses, such as influenza, can be transmitted between vertebrate species
- 22. The major groups of organisms that cause disease are bacteria, fungi, protists and viruses; each group can be distinguished by its structural characteristics
- 23. Understand that gene therapy can be used to treat a range of diseases, including diabetes mellitus.
- 24. Know that hormones and vaccines are developed using recombinant DNA and associated biotechnological techniques.
- 25. Understand the decision to participate in immunisation programs can be influenced by the social, economic and cultural context in which it is considered.
- 26. Appreciate that cell replacement therapy has the potential to treat nervous system disorders including Alzheimer's and Parkinson's diseases

Year 10 ACARA Science B: Sustainable Systems of Health and Energy Module Two: Biology/Human Biology – Health and Disease

Big Picture:

The mammalian body is made of several systems working together. Each system is specialised to carry out specific functions. A body's immune system prevents or responds to invading pathogens that cause disease. When our body is unable to fight off infections we may need medical technologies to help us, for example the use of vaccinations. Vaccinations can result in immunity to infection by exposure to attenuated versions of invading pathogens. In this way, the bodies' health can

be sustained. To improve our ability to reduce the spread of disease scientists need to improve their understanding of the biology of pathogens.

Resource list

1. Human Perspectives Units 3 and 4 (Nelson) Chapter 10

- 2. WA Biology Units 3 and 4 (Nelson) Chapter 12
- 3. Biozone Year 12 Biology Chapter: 'The Nature of Pathogens' AND 'Defence and the Immune System'. (NOTE there is a separate answer booklet)

W k	Theme	Concepts / Content	Student objectives	Skills T = taught for 1st time R = reinforced	RESOURCES / ASSESSMENT/ PRACTICALS
1	Micro- organisms that cause disease	1. Structural features of micro-organisms	 20. List the four micro-organisms that cause disease (bacteria, viruses, protists and fungi). NOTE viruses are not technically living (non-cellular) because they do not share the common traits of living things (homeostasis, reproduction, metabolism (respiration), growth, response to stimuli). 21. Describe the main structural features (cellular/ non-cellular, prokaryotic/eukaryotic, unicellular/multicellular, type of cell membrane/wall) of the four main micro-organisms that cause disease. Compare similar structures and contrast differences. Organise the features into a comparison table. 22. Differentiate between types of bacteria spherical (coccus), rodshaped (bacillus), or curved (spirillum and vibrio). State an example of an infectious disease caused by bacteria such as tuberculosis. 23. Compare DNA with RNA viruses simply. 24. Explain how viruses can replicate (not reproduce). 	R Study skill: Use tables to organise information eg Structural features of 4 micro- organisms	Experiment- Compare the pathogens found on different fomites (S drive) Human Perspectives Units 3 and 4 (Nelson) Chapter 10. Pages 129-131 (only has bacteria and virus) WA Biology Units 3 and 4 (Nelson) Chapter 12. Structural features of four micro-organisms, Pages 410-422 'Key Concepts'. Plus virus life cycle. Vocabulary sheet: S Drive- students can use the hard copy/app/website to practice terminology eg App: Flashcards or website: studystack.com BioNinja: Types of Pathogens https://ib.bioninja.com.au/standard-level/topic-6-human-physiology/63-defence-against-infectio/pathogens.html Lumen Learning: Types of Bacteria https://courses.lumenlearning.com/microbiology/chapter/types-of-microorganisms/

					STILE- The Immune System, 2.1 lessons: Pathogens-basics				
		1. Types of infectious	 State a disease caused by a protist such as malaria. Describe protist pathogens as unicellular eukaryotes that are not classified as plants, animals, or fungi but may have some plant, animal or fungi features. For example, the protist that causes malaria is animal-like. State a disease caused by a fungus such as candidiasis of the mouth or throat. Define the term pathogen. <u>Differentiate</u> between infectious, contagious and non-infectious diseases <u>Distinguish</u> between health, disease, disorder. Define the terms micro-organism, infection, virulence, endemic, epidemic, pandemic, outbreak. Investigate the biology of the virus that causes COVID-19; SARS-CoV-2 (formal name). Relate its structure to its function (ability to penetrate host cells to cause infection). 	R Use ICT interactives to add value to learning	Human Perspectives Units 3 and 4 (Nelson) Chapter 10. Pages 129-131 (only has bacteria and virus) WA Biology Units 3 and 4 (Nelson) Chapter 12. 3	Non- specific defence against infectious disease	External non- specific defence mechanisms	 Compare briefly, the innate (non-specific) and adaptive (specific) immune systems to defend ourselves from pathogens. Describe external non-specific defences (1st line of defence including skin, mucous membranes, hairs and acids) and internal non-specific defences (2nd line of defence including phagocytosis, inflammation and fever). Describe four protective reflexes (external/non-specific defence) and give an example of each. Discuss three ways that infectious diseases are spread: Direct or close contact (transmission within 1-2m such as Ebola and COVID 19) Indirect contact (transmission outside of 1-2m such as measles or on a fomite surface eg table) Vectors (organisms that transmit pathogens from an infected host to a susceptible host eg mosquito. Diseases such as malaria and Ross River virus spread via mosquito vectors). 		https://ib.bioninja.com.au/standard-level/topic-6-human-physiology/63-defence-against-infectio/lines-of-defense.html The Immune System https://courses.lumenlearning.com/wm-biology2/chapter/immune-system/ Human Perspectives Units 3 and 4 (Nelson) Chapter 11 WA Biology Units 3 and 4 (Nelson) Chapter 13.
